<p>STATUS:</p> <p>Prime Battery manufactured various sizes of automobile batteries with maximum production reaching 5,000 batteries per day. The facility generated hazardous levels of lead. In 1989, Prime Battery contracted two independent environmental consulting firms to conduct investigations and environmental site assessments. The results of these investigations revealed lead and sulfuric acid contamination on the property.</p> <p>Late in 1990, Prime Battery suffered severe financial difficulties leading them into bankruptcy proceedings and operations ceased at the Anderson facility. US EPA did an emergency removal action at the site in May of 2002, and further remedial action in the summer of 2003. Enforcement action is pending.</p>
